# Fundamentals of Data Engineering

Week 06 - sync session

datascience@berkeley

# While we're getting started

- Review your Assignment 05
- Get ready to share

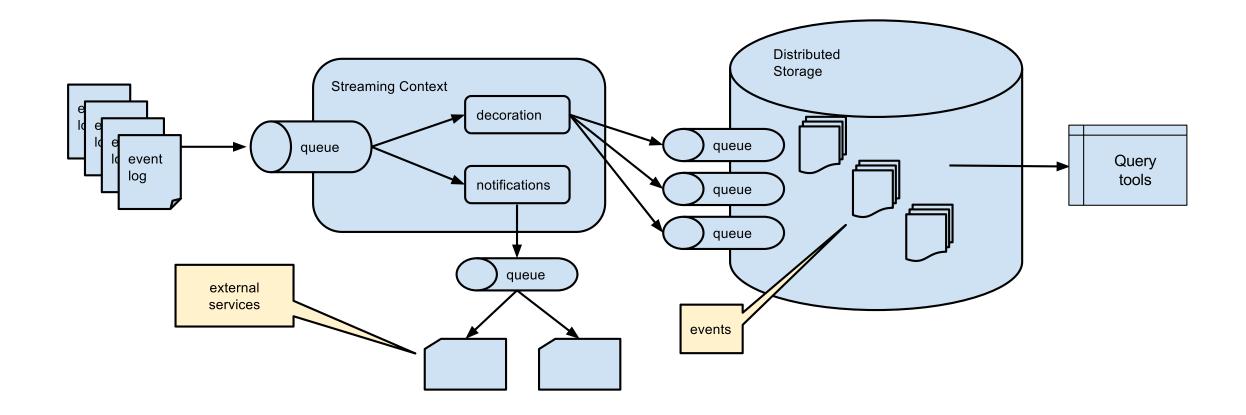

# Groups present notebooks

# Due Friday (PR)

# Pipes

cat junk.csv | sort | uniq | wc -l

# Where are we in the pipeline

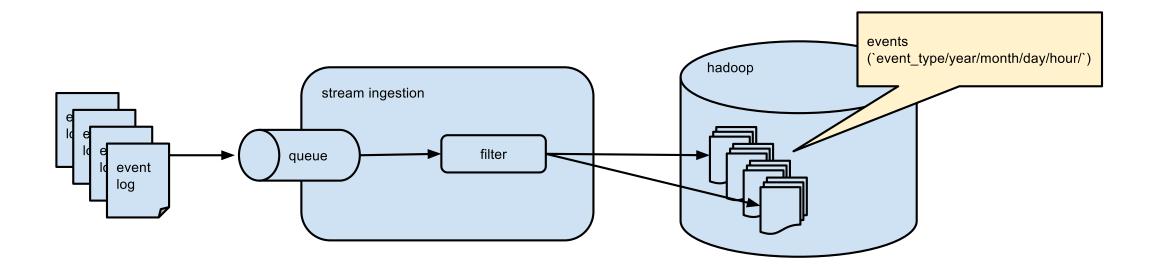

# Starting into Project 2: Tracking User Activity

- In this project, you work at an ed tech firm.
- You've created a service that delivers assessments.
- Now lots of different customers (e.g., Pearson) want to publish their assessments on it.
- You need to get ready for data scientists who work for these customers to run queries on the data.

# Project 2 actitivities

- Through 3 different activites, you will spin up existing containers and prepare the infrastructure to land the data in the form and structure it needs to be to be queried.
  - 1. Publish and consume messages with kafka.
  - 2. Use spark to transform the messages.
  - 3. Use spark to transform the messages so that you can land them in hdfs.

#### Stand alone kafka

# Update your course content repo in w205

```
cd ~/w205/course-content
git pull --all
```

# Docker compose .yml file

- cd w205
- mkdir kafka
- save docker-compose.yml from recently pulled
  - ~/w205/course-content to recently created
  - ~/w205/kafka directory

# Docker compose spin things up

- cd  $\sim/w205/kafka$
- docker-compose up -d
- docker-compose ps

#### Can check with

• docker-compose ps

#### which should show something like

Name	Command	State	Ports
kafkasinglenode_kafka_1 kafkasinglenode_zookeeper_1	/etc/confluent/d /etc/confluent/d	·	±

# Check zookeeper

docker-compose logs zookeeper | grep -i binding

zookeeper\_1 | [2016-07-25 03:26:04,018] INFO binding to port 0.0.0.(

#### Check the kafka broker

docker-compose logs kafka | grep -i started

```
kafka_1 | [2017-08-31 00:31:40,244] INFO [Socket Server on Broke kafka_1 | [2017-08-31 00:31:40,426] INFO [Replica state machine kafka_1 | [2017-08-31 00:31:40,436] INFO [Partition state machine kafka_1 | [2017-08-31 00:31:40,540] INFO [Kafka Server 1], start
```

# Create a Topic foo

```
docker-compose exec kafka \
   kafka-topics \
   --create \
   --topic foo \
   --partitions 1 \
   --replication-factor 1 \
   --if-not-exists \
   --zookeeper zookeeper:32181
```

Created topic "foo".

# Check the topic

```
docker-compose exec kafka \
   kafka-topics \
   --describe \
   --topic foo \
   --zookeeper zookeeper:32181
```

```
Topic:foo PartitionCount:1 ReplicationFactor:1 Configs:
Topic: foo Partition: 0 Leader: 1 Replicas: 1 Isr: 1
```

# Publish Messages

```
docker-compose exec kafka \
  bash -c "seq 42 | kafka-console-producer \
    --request-required-acks 1 \
    --broker-list localhost:29092 \
    --topic foo && echo 'Produced 42 messages.'"
```

Produced 42 messages.

# Consume Messages

```
docker-compose exec kafka \
   kafka-console-consumer \
   --bootstrap-server localhost:29092 \
   --topic foo \
   --from-beginning \
   --max-messages 42
```

```
1
....
42
Processed a total of 42 messages
```

# Tearing things down

docker-compose down

# Kafka with "real" messages

We'll deal with json for the project

# Kafka with json example

• To address json, we'll need kafkacat

#### kafkacat

# docker-compose.yml file

```
version: '2'
services:
  zookeeper:
    image: confluentinc/cp-zookeeper:latest
    environment:
      ZOOKEEPER_CLIENT_PORT: 32181
      ZOOKEEPER_TICK_TIME: 2000
    expose:
      - "2181"
      - "2888"
      - "32181"
      - "3888"
  kafka:
    image: confluentinc/cp-kafka:latest
    donande on.
```

#### Pull data

curl -L -o github-example-large.json https://goo.gl/2Z2fPw

# Spin up the cluster

docker-compose up -d

### Watch it come up

docker-compose logs -f kafka

• Detach with Ctrl-C

use it

#### create a topic

```
docker-compose exec kafka \
  kafka-topics \
    --create \
    --topic foo \
    --partitions 1 \
    --replication-factor 1 \
    --if-not-exists \
    --zookeeper zookeeper:32181
```

### Should see something like

Created topic "foo".

#### Check the topic

```
docker-compose exec kafka \
   kafka-topics \
   --describe \
   --topic foo \
   --zookeeper zookeeper:32181
```

#### Should see something like

```
Topic:foo PartitionCount:1 ReplicationFactor:1 Configs:
Topic: foo Partition: 0 Leader: 1 Replicas: 1 Isr: 1
```

#### Publish some stuff to kafka

#### Check out our messages

```
docker-compose exec mids bash -c "cat /w205/github-example-large.jsor docker-compose exec mids bash -c "cat /w205/github-example-large.jsor docker-compose exec mids bash -c "cat /w205/github-example-large.jsor
```

# Publish some test messages to that topic with the kafka console producer

docker-compose exec mids bash -c "cat /w205/github-example-large.jsor

### Should see something like

Produced 100 messages.

#### Consume the messages

#### We can either do what we did before

```
docker-compose exec kafka \
   kafka-console-consumer \
   --bootstrap-server kafka:29092 \
   --topic foo \
   --from-beginning \
   --max-messages 42
```

#### or

docker-compose exec mids bash -c "kafkacat -C -b kafka:29092 -t foo -

#### and maybe

docker-compose exec mids bash -c "kafkacat -C -b kafka:29092 -t foo -

#### Down

docker-compose down

#### Assignment 06

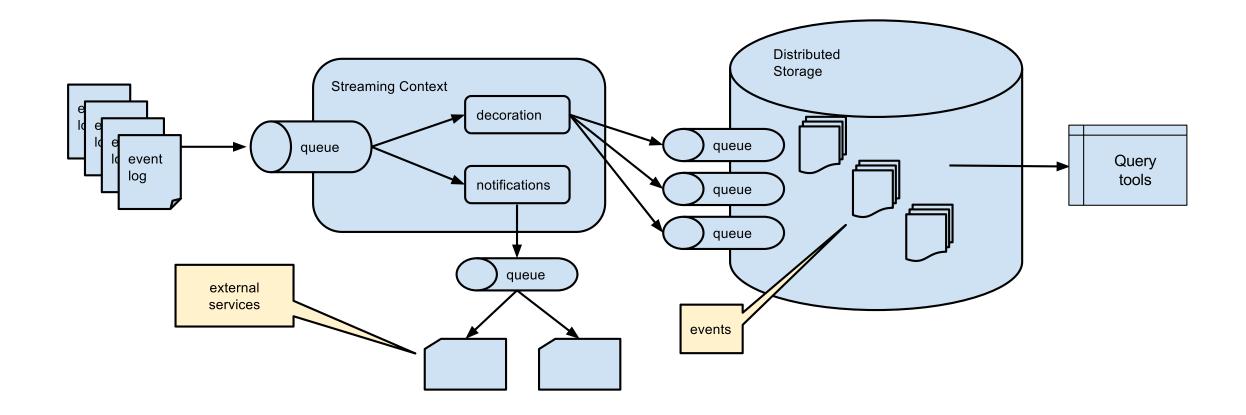

- Step through this process using the Project 2 data
- What you turn in:
- In your /assignment-06-<user-name> repo:
  - your docker-compose.yml
  - once you've run the example on your terminal
    - o Run history > <user-name>-history.txt
    - Save the relevant portion of your history as <user-name>-annotations.md
    - Annotate the file with explanations of what you were doing at each point (See

htmartin-annotations.md)

#### Summary

- Test that we can spin up containers, publish & consume messages with simple numbers messages.
- Work through some actual data from github
- Prep for assignment
